

How to store energy in power plants

Overview

Why do power plants need energy storage systems?

For one, they can make power grids more flexible. In times of low demand, excess electricity generated in power plants can be routed to energy storage systems. When demand rises—during a heat wave, for example—stored energy can be deployed to avoid straining the grid. Stored energy can also provide backup power.

How does energy storage work?

Energy storage helps smooth out intermittent resources' output by discharging during periods of low production. Compared to other generation systems, battery storage systems take up little space for the amount of power they release. The oldest and most common form of energy storage is mechanical pumped-storage hydropower.

Why is energy storage important?

Energy storage can "firm up" renewable resources, maximizing their value to the grid. In addition, energy storage can reduce the cost of electricity (storing energy when it is cheapest, dispatching it when it is most expensive), and increase the reliability of our aging electric grid increasingly strained by climate change.

What is an energy storage system?

An energy storage system (ESS) for electricity generation uses electricity (or some other energy source, such as solar-thermal energy) to charge an energy storage system or device, which is discharged to supply (generate) electricity when needed at desired levels and quality. ESSs provide a variety of services to support electric power grids.

How can energy storage strengthen the grid?

The job of the grid is to deliver electricity to every customer at 120 volts and

60 hertz. This is accomplished by adding or removing current from the grid. A storage device helps by adding or removing current exactly when needed. Read on to learn how energy storage can strengthen the grid.

Can a residential grid energy storage system store energy?

Yes, residential grid energy storage systems, like home batteries, can store energy from rooftop solar panels or the grid when rates are low and provide power during peak hours or outages, enhancing sustainability and savings.
