

Inverter output power ratio

Overview

The DC-to-AC ratio — also known as Inverter Loading Ratio (ILR) — is defined as the ratio of installed DC capacity to the inverter's AC power rating. It often makes sense to oversize a solar array, such that the DC-to-AC ratio is greater than 1.

The DC/AC ratio, also known as the DC to AC ratio, refers to the ratio between the direct current (DC) rated power of a photovoltaic (PV) array and the alternating current (AC) rated output of an inverter. DC/AC Ratio = PV Array's DC Power (kW) / Inverter's AC Power (kW)What is a DC to AC ratio in a solar inverter?

AC (Alternating Current) \rightarrow is the usable power output delivered by the solar inverter after converting DC into AC. Inverters are rated in kWac (kilowatts AC). The DC to AC Ratio —also known as the Inverter Loading Ratio (ILR) —is the simple yet powerful relationship between:

What is the DC/AC ratio of a 5 kW inverter?

For example, a 6-kW DC array combined with a 5-kW AC rated inverter would have a DC/AC ratio of 1.2 (6 kW / 5 kW = 1.2). The key driver here is the "clipping loss": when the DC power feeding an inverter is more than the inverter can handle, the resulting power is "clipped" and lost.

How do you calculate a solar inverter wattage?

First, determine the DC Output (power output of the solar panels in Watts). Next, determine the AC Capacity (power capacity of the inverter in Watts). Next, gather the formula from above = DC to AC Ratio = DC Output / AC Capacity. Finally, calculate the DC to AC Ratio.

Can an inverter output more than rated AC power?

Inverters will generally never output more than their max-rated AC power. During times when the DC input power is too high, the inverter will raise the operating voltage of the modules to pull the array off of its max power point and reduce the DC power. Why a 20% DC/AC ratio results in minimal clipping losses.

What is inverter loading ratio (ILR)?

The Inverter Loading Ratio (ILR) measures the relationship between the total installed solar panel capacity (DC) and the inverter's output capacity (AC). Formula: DC (Direct Current) → Power generated by PV modules, rated in kilowatt-peak (kWp).

What is a good solar inverter ratio?

It determines how efficiently the solar plant uses the inverter. A higher ratio means the inverter works closer to full capacity for longer hours, boosting energy yield and improving project economics. Q3. What is the typical DC and AC Ratio in India?

In India, the ratio usually ranges from 1.2 to 1.35 for utility-scale and C&I projects.
